

## PRESS RELEASE

### Seazona Announces LabEx Integration Enabling Automated Micro-CT Case Transfers

**Tempe, AZ — January 12, 2026 — Seazona**, a leading provider of lab management software for dental laboratories, today announced a new integration with **LabEx**, the cloud platform developed and utilized in conjunction with the Micro-CT scanner and CrownAI™ technologies from **Glidewell**.

The integration enables dental laboratories to automatically and securely transfer Micro-CT scan files and associated case data directly into Seazona cases, eliminating manual uploads and reducing processing time. Files are routed to the correct case based on case identifiers, helping labs streamline workflows and improve accuracy.

The integration is now live, where Micro-CT scans are automatically delivered into each corresponding Seazona case as soon as they are available in the LabEx cloud environment.

“This integration removes friction for labs using Glidewell’s Micro-CT scanner by ensuring scans arrive in the right case automatically,” said Ron De Rose, Director of Technology, Seazona. “Our goal is to let labs focus on production and quality, not file management.”

For laboratories interested in using Micro-CT scans or Intraoral scans enabled with the integration, configuration is handled through Glidewell, where each customer is issued a unique security token to ensure secure data exchange.

The Seazona–LabEx integration reflects a continued commitment to interoperability with leading dental scanning and imaging platforms, supporting modern, fully digital lab workflows.
